

AC/DC

SERVICE AND OPERATION MANUAL

WARNING

IMPORTANT HEALTH WARNING: PHOTSENSITIVE SEIZURES - A very small percentage of people may experience a seizure when exposed to certain visual images, including flashing lights or patterns. Even people with no history of seizures or epilepsy may have an undiagnosed condition that can cause "photosensitive epileptic seizures" due to certain visual images, flashing lights or patterns. Symptoms can include light-headedness, altered vision, eye or face twitching, jerking or shaking of arms or legs, disorientation, confusion, momentary loss of awareness, and loss of consciousness or convulsions that can lead to injury from falling down or striking nearby objects.

IMMEDIATELY STOP PLAYING AND CONSULT A DOCTOR IF YOU EXPERIENCE ANY OF THESE SYMPTOMS.

Stern Pinball machines are assembled in Elk Grove Village, Illinois, USA; each pinball machine has unique characteristics that make it a one-of-a-kind American-made product. Each machine will have variations in appearance resulting from differences in the machine's particular wood parts, individual silk screened art and mechanical assemblies. Stern Pinball has inspected each game element to ensure it meets our quality standards.

The AC/DC mark and logo are owned by LEIDSEPLEIN PRESSE B.V. Used by Stern Pinball, Inc. with permission, all rights reserved.

Games configured for North America operate on 60 cycle electricity only. These games will not operate in countries with 50 cycle electricity (Europe UK, Australia).

1. SETUP AND MOVING

1.1 FIRST-TIME SETUP INSTRUCTIONS

Your brand new Stern Pinball Machine is carefully packed for safety and security. For your safety, exercise caution and use the correct tools and sufficient help when setting up your new game.

TOOLS REQUIRED

- 5/8" Socket Wrench
- Utility Knife
- Snips
- An Assistant

CAUTION: AT LEAST TWO (2) PEOPLE ARE REQUIRED TO MOVE AND MANEUVER THE GAME. USE PROPER MOVING EQUIPMENT AND EXTREME CARE WHILE HANDLING. STERN PINBALL MACHINES WEIGH OVER 250LBS BOXED.

1. Locate the side labeled "TRUCK THIS SIDE ONLY". The bottom of the game faces this side.
2. Open the top box flaps by pulling hard in an upward motion on each flap. If the flaps are taped, cut the tape first, taking care to avoid the box staples.

3. Remove the four (4) foam pieces and two (2) narrow box tubes which contain the four (4) identical legs with levelers.
4. DO NOT CUT STRAPPING YET. Keep backbox secured in the down position.
5. With the utility knife, carefully cut down the left and right corners of the box.

6. Let the face fall forward and remove the entire side by carefully cutting the bottom.
7. With the game still in its folded position, use a 5/8" wrench to loosen and remove the 2 leg bolts on each side of the front cabinet. Ensure the leg levelers are screwed all the way into the legs.

8. Install front legs using the bolts removed from the cabinet. Secure tightly.
9. Have someone help you carefully set the game down on the front legs.

10. Set aside the open box.
11. With a 5/8" socket wrench, loosen and remove the 2 leg bolts on each side of the rear cabinet, 4 total.

12. Using supports or two people, prop the rear of the cabinet up.
13. Ensure the rear leg levelers are screwed all the way into the legs.
14. Install rear legs using the 4 bolts removed from step 11.

FIRST-TIME SETUP CONTINUED

15. Cut nylon strapping and remove protective strap corner guards.
16. Locate the factory keys, either on the shooter rod or taped to the playfield glass.
17. Using snips, cut the tie-wrap securing the keys if required. One set of keys is for the front coin door, the other set of keys is for accessing components in the backbox.

18. Open the front coin door.
19. Reach into the game and remove the retaining clip at the rear of the cash box.
20. Remove the cash box lid by sliding it toward you.

21. Store the backbox keys, if desired, on the metal hook located in the coin door.
22. Locate and remove the pinballs, plumb bob, and backbox bolts from the cash box.
23. Replace the cash box lid and retaining clip for future use.

24. Locate the two (2) backbox bolts in the cash box.
25. Carefully raise backbox to upright position while ensuring that cables are not pinched.
26. Use the $\frac{5}{8}$ " wrench to install the two (2) backbox bolts to secure the backbox as indicated on the back of the cabinet.

27. Reach inside the cabinet and hold and move the yellow top molding lock handle to the left.
28. Remove the front top molding.

29. Remove the playfield glass by sliding it toward you and carefully place it in a safe location. Remove all playfield shipping tie downs, shipping blocks, and packing foam, and follow any game-specific unpacking instructions included in the playfield, if present.

CAUTION: PLAYFIELD GLASS IS MADE FROM HIGH-STRENGTH TEMPERED GLASS. TEMPERED GLASS IS SENSITIVE TO EXTREME TEMPERATURE SHIFTS AND CORNER NICKS, WHICH CAN CAUSE THE GLASS TO FAIL CATASTROPHICALLY. TAKE CARE TO STORE THE GLASS ON A SOFT, ROOM-TEMPERATURE SURFACE AND PREVENT THE CORNERS FROM BEING DAMAGED.

FIRST-TIME SETUP CONTINUED

30. If pinballs were already installed into the lower ball trough, remove them before lifting the playfield.
31. Grasp the lower arch between the flippers, and firmly but gently pull directly up to raise the playfield 8 to 12 inches.
32. While holding the playfield up, pull the playfield toward you until the two playfield supports are over the front edge of the cabinet.
33. Rest the playfield on the front edge of the cabinet.
34. Raise the playfield and rest it against the backbox.
35. Visually inspect all cabinet cables and connector terminations; ensure no wires or cables are pinched and that cable harnesses are not pulled tight.
36. Locate the plumb bob in the parts bag in the cash box.
37. Slide plumb bob onto the hanger wire. Note: the vertical position of the plumb bob affects tilt sensitivity - higher makes the game more sensitive to tilting.
38. Tighten the thumb screw finger-tight.
39. Install the correct number of pinballs. Refer to the decal on the lock down assembly for the correct number of pinballs.

LOCATING, LEVELING, AND FINAL SETUP

1. Select a location that is indoors, out of direct sunlight, and climate controlled. Excessive moisture/humidity can cause long-term damage to your game.
2. Adjust the front or rear levelers as necessary to position the playfield level bubble, located on the front right of the playfield next to the shooter lane, to float between the two (2) black lines. This will place the playfield at the recommended 6.5° pitch. Playfield angles greater than 6.5° can be achieved by turning out the rear leg leveler(s) for increased difficulty and faster gameplay.
3. Use a pinball to roll down the center of the playfield for side-to-side leveling, or use an external bubble level, digital level, or smartphone level app.
4. Plug into a grounded outlet and check for proper operation through DIAGNOSTICS.
5. Check the coin door: With the door closed, insert coins to verify proper operation.
6. Play game: Check for satisfactory operation and adjust game volume (push the Red Buttons inside the Coin Door).
7. If desired, perform any game diagnostics, game adjustments, and pricing settings at this time.

1.2 ADJUSTMENTS MENU

STANDARD ADJUSTMENTS

Perform the below steps to review the adjustments.

Enter the Service Menu, then enter the Standard Adjustments Menu.

Press SELECT. Press BACK to exit or escape at any time.

Press [>]. Go to the ADJ icon. Press SELECT.

Go to the S.P.I. icon. Press SELECT.

STANDARD ADJUSTMENT #1 appears with the adjustment name flashing. While the adjustment name is flashing press [<] [>] to move between adjustments.

To change the adjustment setting press SELECT. While the adjustment setting is flashing, press [<] [>] repeatedly until the desired setting appears. Press the SELECT button to “install” the change. The adjustment comment (bottom line) will indicate if the factory default setting is selected or will display INSTALLED if the change is not a factory default setting.

FEATURE ADJUSTMENTS

Each table has feature adjustments specific to the characteristics of that game. To access feature adjustments enter the Service Menu and then enter the Adjustments Menu.

Press SELECT to access the Service Menu. Press BACK to exit or escape at any time.

Press [>]. Go to the ADJ icon. Press SELECT.

Go to the game icon. Press SELECT.

FEATURE ADJUSTMENT #1 appears with the adjustment name flashing. With the adjustment name flashing press [<] [>] to move between adjustments. Feature adjustments are changed similarly to standard adjustments using the SELECT button to choose options and the [<] [>] buttons to cycle through available settings.

1.3 TRANSPORTING THE GAME

When transporting the game, such as in the back of a truck or with a hand truck, the game's backbox must be secured to prevent damage to the side rails.

1. SECURE THE BACKBOX

1. Ensure that the pinballs are removed from the playfield, and secure any free-moving mechanisms that may get damaged in transport

2. Remove the backbox securing bolts
3. Carefully lower the backbox onto the side rails. Use a piece of cardboard or suitable padding between the backbox and the game.

TOOLS REQUIRED

- STRAP (500LB OR GREATER)
- AN ASSISTANT
- HAND TRUCK

4. Securely strap the back box to the game
5. The game may be transported with the legs on. If the legs must be removed, follow the remaining steps.

CAUTION

NEVER TRANSPORT THE GAME IN A MOVING VEHICLE WITH THE BACKBOX RAISED! TWO PEOPLE ARE REQUIRED TO REMOVE THE LEGS!

2. REMOVE THE LEGS AND STAND UP

6. Remove the legs, rear legs first. Use a stool or a friend to support the rear of the game.
7. Rest the rear of the game on the ground.

8. Stand the game up on its back.

9. Remove the front two legs.

10. Secure all loose parts and transport with a hand truck in the upright position.

1.4 MAINTENANCE

REGULAR MAINTENANCE - (MONTHLY/500 GAMES)

- Remove the playfield glass
- Enter the software diagnostics menu, start lamp test, then clean and wax the playfield.
- ◊ While cleaning the playfield, identify and repair malfunctioning lights, loose parts, cracked plastics and worn rubber parts.
- While in diagnostics, enter the switch test (Select the "SW" icon, then "TEST" icon).
- ◊ Use a pinball to actuate all switches and verify the correct switch registers with the switch test.
- ◊ The game will play a sound to confirm the switch.
- Lift the playfield and inspect all assemblies for loose parts, broken wires or excessive wear. Look at the bottom of the cabinet for any parts that may have worked loose, then find the source.
- Check all coin door mechanisms and bill acceptor (if installed) for proper operation
- Play the game to ensure all coils and features are working
- Check the playfield to ensure it is level and set to the proper pitch using the bubble level on the right side wood rail.
- Check game audits: Replay % and Ball Time and note abnormal values which can indicate problems.
- Ensure game volume is set appropriately for the location.
- Clean both sides of the playfield glass and reinstall.
- Check and clean pinballs and replace if excessively worn or scuffed. Dirty pinballs accelerate game wear.

OVERHAUL MAINTENANCE (5000 GAMES)

- Verify latest game software is installed
- Check flippers for excessive wear. Excessive flipper sloppiness (vertical or horizontal) or weakness indicates a flipper rebuild is required.
- Clean machine inside and out and check leg levelers for free operation.
- Visual check for loose or broken playfield and cabinet parts and repair as necessary.
- Electrical check: Plug into grounded outlet and check for proper operation through DIAGNOSTICS.
- Replace worn or dirty rubbers.
- Replace pinballs.
- Check all playfield switches with a pinball.
- Check all settings (refer to manual for factory settings).
- Check coin door: With door closed, insert coins to verify proper operation.
- Check for proper adjustment of the plumb bob tilt.
- Play game: Check for satisfactory operation.

COMMON PINBALL TOOLS

- Common nut drivers (1/4", 5/16", 11/32", 3/8")
- Phillips screwdriver
- Standard Allen wrench/Hex key set
- 5/8" Socket with ratchet
- Adjustable wrench (5/8" & 9/16")
- 6" Torpedo Level (or use a pinball)
- Flashlight or headlamp
- Soldering Iron (60w with flat tip), lead-free solder
- Wire cutter
- Wire stripper
- Long nose ("needle nose") pliers

1.7 UPDATING GAME CODE FOR THE S.A.M. SYSTEM

Game code is subject to change. Update this game with the latest code downloaded from our website, from another game, or order from your local distributor.

Upon powering up, the display will describe the version of code installed in your game. When directed to do so (via Service Bulletin or website announcement) you will need to update your code with the boot flash EPROM installed, here's how:

STEP 1

Open the backbox and locate the 8-position DIP switch (SW1 on the CPI/Sound board)

STEP 2

Switch DIP switch #8 to 'ON' (Boot flash EPROM must be installed)

STEP 3

Press the white reset button (S1 RESET on the CPU/Sound board) or power cycle the game OFF/ON (ON/OFF switch is located on the outside of the cabinet bottom, front right).

STEP 4

Using the 4-button service switch set (inside the coin door):

4A: Press [SELECT] to begin.

4B: With the "UPDT" icon highlighted, press [SELECT].

4C: Insert the memory stick (with the latest files) into the USB port.

4D: If more than one file is present on the memory stick, press [<] or [>] to locate your file. Press [SELECT] to update.

4E: Follow on-screen prompts.

Green Button

Press to escape back (or exit)

Red Buttons

Press to move <Left, Right>. Press to - Decrease or + Increase values or to change settings.

FOR PROPER OPERATION OF THIS PIN-BALL GAME, <4> PINBALLS MUST BE INSTALLED IN THE 4-BALL TROUGH!

1.9 SERVICE SWITCH & CPU DIP SWITCH SETTINGS

SERVICE SWITCH X4 SET OVERVIEW

Open the coin door to access the service switch X4 set.

The four buttons (inside the coin door) have dual functions depending on if you have entered the Service Menu or not.

FUNCTIONS IN GAME OR ATTRACT MODE

FUNCTIONS IN THE SERVICE MENU

EXAMPLE

To enter the Service Menu, then enter the Switch Test Menu via the Diagnostics Menu, perform the below steps.

STEP 1

Press [Select].

STEP 2

With the "DIAG" icon highlighted, press [Select].

STEP 3

With the "SW" icon highlighted, press [Select].

STEP 4

With the "TEST" icon highlighted, press [Select].

Press any switch. If wired correctly, the information in the display will match the information in the Switch Matrix.

Press [<] or [>] to move left or right through the menus.

Press [Back] to get back a menu, exit, or escape at any time.

1.10 DIAGNOSTIC AIDS

This audible/visual alert display is shown when the 50V/20V power is disabled (by opening the coin door). Pull out the interlock switch only while in the service menu for coil, switch, or play testing when the coin door is required to stay open for service button use! Pulling out the power interlock switch or pressing the 'escape' green [BACK] button will remove the alert display. Initial display presentation is accompanied by 3 audible tones (the bright display warning will go dim after approximately 30 seconds).

This alert display is shown momentarily during game mode or powering up to alert the operator of a device malfunction (device or mechanism doesn't energize or is energized repeatedly). OPERATOR ALERT! works by monitoring any switch activated device that has the potential to trap a ball when disabled (e.g. in the shooter lane, scoop, or eject holes, etc.). This alert can also appear if a switch associated with a device (e.g. ball trough, auto plunger, etc.) is stuck closed (caused by a switch jam or stuck ball); the

game will activate the device a predetermined number of times and if the problem is still detected, this device or switch will be noted in Switch Alerts and/or Technical Alerts.

Upon entering the service menu, if an asterisk "*" is displayed after the words "SERVICE MENU", the game has detected possible faulty devices, switched, and/or missing pinballs. Press either of the red buttons (short-cut to the technical alerts menu) or continue into the service menu (press the black button again), select the "DIAG" icon and "TECH" icon or the technical alerts information.

2. SERVICE MENU SYSTEM

2.1 SERVICE MENU INTRODUCTION

Important: The switch bracket holds the playfield power interlock. It is located just inside the coin door frame. The button switch for the playfield power interlock switch must be pulled out for electro-mechanical device testing or diagnostic purposes (this is required). If this button is pushed in, the playfield power is disabled while the coin door is open.

HOW TO USE THIS SECTION

This section will cover all functions available in the service menu in a step-by-step process. This section is divided into chapters which coincide with the main menu (will also provide more detailed information). The previous and following pages in this chapter will instruct the operator on how to move through the menus. It's simple, easy, and fun to use!

After powering up, push down the black "select" button to begin. Looking at the display you will momentarily see "SERVICE MENU" followed by the main menu.

Use the red [←/→] and [+/>] buttons to move the selected icon left or right, and the black "select" button to activate the selected icon.

The main menu now appears with the "DIAG" icon (go to diagnostics menu) highlighted.

As the operator views the menu screen(s), the "More" [←/→] symbols indicates that there are more icons to select in each direction. The icon selected will blink. Pushing the black "select" button will select the icon and the menu screen will change to the menu selected. Press the green "back" button to move backwards through the menu levels. Press the green "back" button repeatedly or select the "QUIT" icon to completely exit out of the service menu mode.

View the service menu icon tree on the next pages for a complete overview of all menus used in this system. The "HELP" icon provides an explanation of the icon usage or any other information in the menu where the "HELP" icon was selected (when available).

DIAG: Go to diagnostics menu | AUD: GO to audits menu | ADJ: Go to adjustments menu | UTIL: Go to utilities menu (Installs, Custom MSG. Custom Pricing, Set Time, Reset, & USB) | TOUR: Go to tournament menu (Start Tournament, View Tournament Data, Sign Messages)

Use both the manual and the display to help customize, troubleshoot, and/or diagnose faults, if any.

2.2 SERVICE MENU ICON TREE

SERVICE MENU ICON TREE CONTINUED

2.3 PROBLEM/SOLUTION TABLE

In the main menu and in all sub-menus (where the “QUIT” icon is present), if the “QUIT” icon is selected and activated, or the green “BACK” button is pressed repeatedly (depending on which sub-menu you are in), the service menu session will be exited and returned to the attract mode.

Turning the game on/off will start the power-up routine. Upon power-up, the display will indicate the country, file version, and language(s) installed. Language/Country change via DIP switch.

Problem	Solution
Will not enter the service menu after depressing the black [SELECT] button.	• Check the service switches [Green, Red, Red, Black] for loose connections or bad ground. • Check the associated wiring harness to/from the CPU/sound board, connector J13. • Check the CPU/sound board for possible failure
All the service buttons appear to be nonfunctional.	• Check the service switches wiring harness for poor or no connection and/or broken wires.
The green button in the attract mode will not enter the service credits menu to add service credits.	• Check to make sure the game is not in Free Play. If the game is set to Free Play, adding service credits is not required. • Check the service switches wiring harness for poor or no connection and/or broken wires.
The display “blanks out”.	• Check the dot matrix display for loose wiring harnesses, for poor or no connection, and/or broken wires. • Check F1 (3/4A fuse) on the display power supply board.
Icons scroll along continuously in the main menu.	• Check for stuck switches on either of the red buttons.
The start and flipper buttons do not select or activate icons in the switch test menu.	• This is normal. These switches are deactivated as they are part of the switch test.
Can't move selection of the icons with the left and/or right flipper buttons.	• Check the flipper buttons for loose connections or bad grounding. • This is normal only in diagnostics switch & active switch tests
Some icons appear to be non-functional in the menu or missing.	• Some functionality of the service menu may not have been completed during development. If absent, it should only be a non-critical function such as the “HELP” icon, which will explain the usage of icons. When completed, a software update will correct the problem. Software updates are announced via Service Bulletins and on our website (http://www.sternpinball.com/service-bulletins)
In the coil test menu, the coils and flashlamps do not fire after pressing the black “SELECT” button.	• Ensure the power interlock switch is pulled out.
In the service menu, the volume cannot be adjusted with either of the red buttons.	• The volume adjustment can only be made when in the attract mode.
In the service menu, the display seems to lock up or the help display appears to be non-functional	• If you cannot clear the situation by exiting back one menu, exit completely out of the service menu and re-enter. If the problem persists, call technical support for additional help.

2.4 DIAGNOSTICS MENU

To initiate, from the main menu select the “DIAG” icon. The diagnostics menu provides the tests for switches, coils, flash lamps, lamps, sounds, and dots in the dot matrix display. Each feature may be tested manually or automatically after entering the service menu. The [CYCLING COIL TEST]/[FLASH LAMP TEST] may be used for a quick verification of automatic test functions. The [SWITCH TEST] / [SINGLE COIL TEST] / [SINGLE LAMP TEST] / [ALL LAMP TEST] / [ROW LAMPS TEST] / [COLUMN LAMPS TEST] / [FLASH LAMP TEST] may be used for troubleshooting.

All diagnostics menu icons and their usages are explained throughout this chapter in the same order as seen in the dot matrix display. Note: Depending on the game type, version, selections made, DIP switch settings, location and/or areas, some icons may appear non-functional or may not appear at all. Some icons change depending on selection (e.g. Selecting and activating the “STRT” icon [Start Tournament] will be replaced with the “STOP” icon [Stop Tournament]). Icons and/or functions, order, and operation are subject to change.

Important: Upon power-up (game CPU reset) or opening the coin door, watch the display for any alerts.

This audible/visual alert display is shown when the 50v/20v power is disabled (by opening the coin door). Pull out the interlock switch only while in the service menu for coil or switch testing & burn-in when the coin door is required to stay open for service button use. Pulling out the power interlock switch or pressing the ‘escape’ green [BACK] button will remove the alert display. Initial display presentation is accompanied by 3 audible tones (the bright display warning will go dim after approximately 30 seconds).

This alert display is shown momentarily during game mode or power-up to alert the operator of a device malfunction (device or mechanism doesn’t energize or is energized repeatedly). Operator Alert works by monitoring any switch activated device that has the potential to trap a ball when disabled (e.g. in the shooter lane, scoop, or eject holes, etc.). This alert can also appear if a switch associated with a device (e.g. ball trough, auto plunger, etc.) is stuck closed (caused by a switch jam or stuck ball); the game will activate the device a predetermined number of times and if the problem is still detected, this device will be noted in Switch Alerts and/or Technical Alerts.

Upon entering the service menu, if an asterisk “*” is displayed after the words “SERVICE MENU”, the game had detected possible faulty devices, switches, and/or missing pinballs. Press either of the red buttons (short-cut to the technician alerts menu) or continue into the service menu (press the black button again), select the “DIAG” icon and “TECH” icon for the technician alerts information.

CAUTION! Remove all pinballs from the ball trough prior to lifting the playfield to its full upright position for servicing. Pull out the power interlock switch for operation. To eject pinballs, select the “DIAG” icon from the main menu to enter the diagnostics menu. Select the “CLR” icon to enter the ball trough test menu. Press the black [SELECT] buttons. To return to the diagnostics menu, press the green [BACK] button. This feature is also useful to retrieve a pinball for game testing in switch or coil tests.

SWITCH MENU

To initiate, from the diagnostics menu, select the “SW” icon. Switches are configured in a 4 x 16 matrix of rows [Switch Drives] and columns [Switch Returns] with up to 64 possible switches. Dedicated switches are configured in a 2 x 16 matrix of rows [Dedicated Switch Drives/Ground] and columns [Dedicated Switch Returns] with up to 32 possible dedicated switches (includes the 8 DIP switch positions). The switch test menu consists of three (3) parts: Switch & Active Switch Tests and Switch Alerts to test all switches.

Reminder: The flipper & start buttons (part of switch tests) are temporarily disabled as service navigation buttons during these test(s) so they can be tested and shown on-screen. Pressing the green [BACK] button (dedicated switch D-21), light green-black / black (GND), will exit the switch test or active switch test.

SWITCH TEST

To initiate, from the switch menu, select the “TEST” icon. Ensure the power interlock switch is pulled out if testing with the coin door open and the activation of coils is required. Upon entering switch test, you will notice that some switches are already indicated as closed. In the examples, the 4-ball trough switches #18, #19, #20, & #21 are shown closed (pinballs at rest in the ball trough), along with the flipper E.O.S. dedicated switches D-10 & D-12 (End-of-Stroke switches are ‘normally closed’). If the game has more flippers with E.O.S. dedicated switches, CPU DIP switch setting other than 1-8 OFF or switches stuck closed, more dots will be indicated (enter active switch test to reveal the names).

In Switch Test, close each switch and observe the display (switch closure is accompanied by a short audible tone). In the example, the black [SELECT] button dedicated switch D-24 is pressed. The dot matrix display will light up (highlight) the corresponding dot in the on-screen matrix, display the switch name, switch number, and the switch drive/return wire colors. When not closing a switch, the display indicates NONE and the last switch number closure. For the switch matrix grid and dedicated switch grid, escape out of this test and enter Active Switch Test (described below) to view the names of the switches closed. Note: Pressing the green [BACK] button (Ded. Switch D-21), Lt. green-black / black (GND), will exit the switch test.

CAUTION! Coil mechanism when activated has fast moving parts! While performing Switch Test with the coin door closed or open (with the power interlock switch pulled out), do not use your finger to test switches which are associated with a coil mechanism such as a vertical up-kicker (hole with a switch), slingshots, bumpers, etc.

Typical Switch Wiring & Schematic

ACTIVE SWITCH TEST

To initiate, from the switch menu select the “ACT” icon. In Active Switch Test, if any switches are stuck closed (or normally closed from the presence of pinball(s) as in the ball trough), the display will flash the corresponding dot(s) in the on-screen matrix, display the name, and display the switch drive/return wire colors. If more than one switch is closed, the switch information will change with each switch. This cycle continues until all switches are cleared or until Active Switch Test is exited. In the example, the black [SELECT] button dedicated switch D-24 is pressed and held down. The display will cycle and flash each dot, naming each switch which is closed. To determine the switch number, compare the highlighted dot to the same position in the switch matrix grid.

SWITCH ALERTS

To initiate, from the switch menu, select the “ALRT” icon. In Switch Alerts Menu, possible inoperable switches are marked with an “X” (Out of Service). Mark switches “IN” or “OUT OF SERVICE” by pressing the black button while the intended switch is highlighted and change with either of the red buttons.

Switches which are determined as “OUT OF SERVICE” by the game or manually, will be automatically marked as “IN SERVICE” as soon as the game determines a valid switch closure (after adjusting, fixing or replacing the switch, then testing/actuating the switch). Note: A factory reset will also put the switch back “IN SERVICE” in which the game will need to redetermine if the switch should be marked “OUT OF SERVICE”.

COIL MENU

To initiate, from the diagnostics menu select the “COIL” icon. Coils #01 - #16 are typically high current coils (although low current coils may be used in these positions & will be noted). Coils #17 - #32 are typically low current coils. Flash lamps are typically used in positions #25 - #32 (although flash lamps may be used in any position and will be noted). Auxilliary coils may be used in positions #33 - #35.

Remember, use the green button to go [BACK], exit, or escape, the red buttons to [</>] GO BACK [>/>] GO FORWARD, and the black button to [SELECT] ENERGIZE the coil (solenoid) or flash lamp.

SINGLE COIL TEST

To initiate, from the coil menu select the “TEST” icon. Ensure the power interlock switch is pulled out if testing with the coin door open. Upon entering single coil test, you will notice the #1 coil is shown. The dot matrix display will indicate the coil or flash lamp name, coil (solenoid), or flash lamp number and the coil or flash lamp power line / drive transistor control line wire colors. To determine the “pin-outs” from the I/O power driver board, the coil voltage gauge-turns or lamp type, view the coil detailed chart table.

CYCLING COIL TEST

To initiate, from the coil menu select the “CYC” icon. Ensure the power interlock switch is pulled out if testing with the coin door open. The test pulses each regular coil or flash lamp sequentially (cycling) on the playfield and in the backbox (if coils or flash lamps are used). The dot matrix display indicates the same information you will find in Single Coil Test.

FLASH LAMPS MENU

To initiate, from the diagnostics menu select the “FLASH” icon. The two tests allows the technician to easily spot any burned-out flash lamps and replace them. Unlike Single Coil Test, which tests all coils (solenoids) including flash lamps, Single and Cycling Flash Lamp Tests test only the flash lamps used in the game. Flash lamps are typically used in positions #25 - #32 (although flash lamps may be used in any position and will be noted).

Remember, use the green button to go [BACK], exit, or escape, the red buttons to [</>] GO BACK [>/>] GO FORWARD, and the black button to [SELECT] ENERGIZE the flash lamp.

SINGLE FLASH LAMP TEST

To initiate, from the flash lamps menu select the “TEST” icon. Ensure the power interlock switch is pulled out if testing with the coin door open. Upon entering Single Flash Lamp Test you will notice the first flash lamp is shown. The dot matrix display will indicate the flash lamp name, flash lamp number, and the flash lamp power line / drive transistor control line wire colors. To determine the “pin-outs” from the I/O Power Driver Board or lamp type, view the coil detailed chart table.

CYCLING FLASH LAMP TEST

To initiate, from the flash lamps menu, select the “CYC” icon. Ensure the power interlock switch is pulled out if testing with the coin door open. The test pulses each flash lamp sequentially (cycling) on the playfield and in the backbox (if flash lamps are used). The dot matrix display indicates the same information you will find in Single Flash Lamp Test.

LAMP MENU

To initiate, from the diagnostics menu select the “LAMP” icon. Controlled lamps are configured in an 8 x 10 matrix of rows [Lamp Returns / Ground] and columns [Lamp Drives / 18VDC] with up to 80 lamps possible. The lamp test menu consists of five (5) parts: Single Lamp Test, Test All Lamps, Row Lamp Test, Column Lamps Test, and Ordered Lamps Test to test all lamps.

Remember, use the green button to go [BACK], exit, or escape, the red buttons to [←] GO BACK/LEFT [→] GO FORWARD/RIGHT, and the black button to [SELECT] next or as “OK / ENTER”.

SINGLE LAMP TEST

To initiate, from the lamp menu select the “ONE” icon. As each lamp is selected, the lamp will light at its location on the playfield as well as the dot matrix display. Upon entering Single Lamp Test, you will notice the #1 lamp is shown. The dot matrix display will

light up (highlight) the corresponding dot in the on-screen matrix, display the lamp name, lamp number and the lamp return/drive wire colors.

ALL LAMPS TEST

To initiate, from the lamp menu select the “ALL” icon. Upon entering All Lamps Test, you will notice the dot matrix display is flashing “ALL LAMPS ON” and the lamps on the playfield will be lit, alternating between rows in the lamp matrix grid. The dot matrix display will light up (highlight) all of the dots in the on-screen matrix.

ROW LAMPS TEST

To initiate, from the lamp menu select the “ROW” icon. As each lamp row is selected, the lamps in the row will light on the playfield as well as the dot matrix display. Upon entering Row Lamps Test, you will notice that the #1 lamp row is shown. The dot matrix display will light up (highlight) the corresponding row of dots in the on-screen matrix, display the lamp row number, the lamp

return wire colors, the I/O PCB connector, and transistor number.

COLUMN LAMPS TEST

To initiate, from the lamp menu select the “COL” icon. As each lamp column is selected, the lamps in the column will light on the playfield as well as the dot matrix display. Upon entering Column

Lamps Test, you will notice that the #1 lamp column is shown. The dot matrix display will light up (highlight) the corresponding row of dots in the on-screen matrix, display the lamp column number, the lamp drive (18VDC) wire colors, the I/O PCB connector, and IC number.

ORDERED LAMPS TEST

To initiate, from the lamp menu select the “ORD” icon. If required, this icon will appear in the lamp menu. Identical to Single Lamp Test, however, the lamps lit are not in the lamp matrix numeric order, but ordered and arranged in separate localized

grouping(s) for easier lamp checking.

Typical Lamp Wiring & Schematic

GAME SPECIFIC TESTS

To initiate, from the diagnostics menu select the “GAME” icon. Ensure the power interlock switch is pulled out when testing with the coin door open. The menu is provided to allow the technician a simple method of testing game specific coils and/or switches, if required.

BALL TROUGH TEST

To initiate, from the diagnostics menu select the “CLR” icon. Ensure the power interlock switch is pulled out if testing with the coin door open. The menu is provided to allow the technician a simple method of removing the balls from the trough and also to test functionality of the trough, ensuring proper trough operation. Upon entering Ball Trough Test, you will notice that four switches are already indicated as closed. In the example, the 4-ball trough switches #18, #19, #20, & #21 are shown closed (pinballs at rest in the ball trough). To return to the diagnostics menu, press the green [BACK] button.

Press the black [SELECT] button to eject the ball in the first position Switch #21 (VUK OPTO Trough #1 (R)). Simultaneously, the dot matrix display and the playfield will eject the ball to the trough up-kicker, eject from the trough up-kicker into the shooter lane momentarily closing switch #23 (shooter lane), and is ejected onto the playfield where the technician can easily retrieve the pinball or allow the ball(s) to re-enter the trough to continue Ball Trough Test. The dot matrix display indicates switch #18 (4-ball trough #4 (L)) as open as the remaining three (3) pinballs shift over one (1) position to the right. If the technician allows the rejected pinball to re-enter the ball trough, the dot matrix display will indicate switch #18 as closed. Reminder: Switch #22 is the stacking OPTO switch ; if more than five (5) pinballs are used the additional switches will be noted. In this game four (4) pinballs are used and required for proper operation.

CAUTION! Continuous use of the above test may overheat the trough up-kicker coil.

TECHNICIAN ALERTS

To initiate, from the diagnostics menu select the “TECH” icon. This menu is provided to show any switch problems and/or missing pinballs. If this icon is not blinking, there are no technician alerts. If upon entering the service menu the display indicated an asterisk [*] and “USE -/+ TO VIEW TECH. ALERTS”, alerts are present (the above “TECH” icon will also blink).

After selecting this icon, the display will indicate the alert(s). If there are 2 alerts present, the display will indicate (1/2) with the 1st alert on display. Press the red [+>] button to view the second alert (2/2). The second number in the parenthesis after the slash indicates how many alerts total are present. To return to the diagnostics menu, press the green [BACK] button.

Note on Switch Detection: During gameplay, activation of switches are continuously monitored. For a switch to be determined as inoperable, or “OUT OF SERVICE”, up to twenty games or so must be played for a switch to be automatically marked as “OUT OF SERVICE”. In programming, if a switch is determined to be faulty, gameplay is compensated. Switches noted as “OUT OF SERVICE” are determined to be stuck closed or open depending on switch usage. Free up the switch actuator, adjust, or replace if necessary. Performing a valid switch closure will put the switch back “IN SERVICE”.

Determination of switch usage can be checked in Audits. Find the associated audit with the switch in question and check usage; compare the numbers to commonly used switches. After any switch is checked and repaired or replaced, it's suggested to test the switch in the Switch Test or Single Coil Test where the associated coil to the switch can be tested as well. After correcting the problem, the switch will be marked “IN SERVICE” and the switch is again monitored as specified above. Only you can determine if a switch marked “OUT OF SERVICE” is actually inoperable or if it is just not getting actuated during gameplay.

Note on Pinball Detection: While in the technician alerts menu, if the following is displayed, the game has detected one (1) or more pinball(s) missing and has compensated for the last pinball(s) to provide normal gameplay.

During gameplay a pinball can get trapped or stuck. If after approximately 15 seconds of inactivity or “no scoring”, Ball Search is started. Note: If the pinball is in the plunger lane or “held” on the flipper, no ball search will be performed. The game will perform one ball search in an attempt to “find” or free-up the pinball.

If the games does not see a switch closure (indicating the pinball has not been found), the dot matrix display may indicate [LOCATING PINBALLS PLEASE WAIT...], during which Ball Search will continue until the timer runs out (this feature will not happen if the game is in Competition Mode. Ball Search will continue until the pinball is found, unstuck and/or replaced manually). The display will momentarily acknowledge the missing pinball(s). The game will provide another pinball into play and will compensate for the lost pinball. Gameplay will appear normal.

Note: This detection and compensation will happen with every pinball if each suffers the same fate of a ball trap. If all balls get trapped, the game cannot be played or started until the situation is rectified.

Important: Determine where the pinball is! Do not add pinball(s) until it is determined the pinball(s) are indeed missing and not just stuck. The most common places for a pinball to be stuck is in device holes (ejects and VUKs) or ball troughs. Determine that all devices are functioning properly. Check around plastic pieces and ramps to see if pinballs have gotten jammed or stuck.

When the found pinball or a replacement pinball is added to the ball trough, the technician alert will immediately clear and will then indicate any remaining alerts (if present) or “NO TECHNICIAN ALERTS”.

Enter the Ball Trough Test to cycle the pinballs and to check proper switch and coil operation. If a pinball was added, and the originally stuck pinball has freed itself at a later time, the game will not operate correctly.

Note on Device Malfunction: While in the technician alerts menu, if the following is displayed, the game has detected a “device malfunction”. Check the device indicated (coil and/or switch).

KNOCKER TEST

To initiate, from the diagnostics menu select the “KNO-CKER” icon. The digitally remastered “knocker” is sounded. The knocker sound is used to alert the player if they have recieved a special replay or a credit from the Match Award feature. Press the black [SELECT] button to activate the knocker. To return to the diagnostics menu, press the green [BACK] button.

SOUND/SPEAKER TEST

To initiate, from the diagnostics menu select the “SPKR” icon. This system produces true digital stereo sound from backbox and cabinet speakers or “mono” on the cabinet speaker (when used by itself). This menu is provided to allow the technician a simple method of testing the speakers if rewired or replaced.

Upon entering the Sound/Speaker Test, you will notice the dot matrix display indicating the first option of available music and/or sound(s) in this test. Press the red [+/->] button to cycle through the available music and/or sounds and press the black [SELECT] button to play the option shown in the dot matrix display. Press the green [BACK] button to exit.

SOUND / SPEAKER TEST
MUSIC: MAIN PLAY
#1
PRESS 'SELECT' TO PLAY

SOUND / SPEAKER TEST
MUSIC: MAIN PLAY
#1
PLAYING SOUND #1

SPEAKER PHASE TESTING

Connections to each of the speakers are polarized and each must be connected appropriately for the best sound quality. If one speaker has the positive and negative connections reversed with respect to the other, bass frequencies will not be produced properly and the overall sound quality will be poor. To test for proper speaker phasing, use the Sound/Speaker Test to cycle through the available music and sound. If the sound is not balanced or doesn't sound correct, check the speaker wiring.

1. Check each speaker for polarity markings. If the speakers have polarity markings, verify the backbox speaker RED-BLK wires and the cabinet speaker YEL-BLK wire(s) are connected to the negative (-) terminal.
2. Disconnect the speaker output connector J10 (AUDIO) from the CPU/sound PCB (in the backbox) and connect a 1.5v battery across each speaker pair one at a time while observing the speakers.
3. Make sure the positive (+) battery terminal is connected to the positive lead [J10, Pin-2, CH A+] (RED-WHT) or [J10, Pin-4, CH B+] (YEL-WHT) each time. As the connection is made, check speaker cone movement; proper connections are indicated by outward movement.

BEGIN BURN-IN

To initiate, from the diagnostics menu select the “BURN” icon. After selecting this icon, the burn-in test will start. Ensure the power interlock switch is pulled out if testing with the coin door open (required for coil function). Upon entering Burn-In Test, the game will exercise all CPU I/O functions: Dot Matrix Display Test, Coil Cycling Testing, All Lamps Test, and Sound/Speaker Test. Press the green [BACK] button to pause and to view cumulative burn-in minutes. Press the green [BACK] button again to return to the diagnostic menu.

DOT MATRIX TEST

To initiate, from the diagnostics menu select the “DOT TEST” icon. After selecting this icon the dot matrix test immediately begins. The dot matrix display will immediately and continuously illuminate and cycle each of the 5 tests for 1 pass each. To return to the diagnostics menu, press the green [BACK] button.

3. PARTS IDENTIFICATION & LOCATION

3.1 BACKBOX PARTS

EXTERNAL

ID	Part Number	Description	Qty
1	830-52M7-00	Translite Art	1

GENERAL ILLUMINATION - RED LED GI LAMPS

GENERAL ILLUMINATION - BLUE LED GI LAMPS

GENERAL ILLUMINATION - VIOLET LED GI LAMPS

3-FLIPPER CIRCUIT WIRING DIAGRAM

TECHNICAL OVERVIEW

Our flipper system used one supply voltage (+50VDC) for both kick & hold. Once the game CPU detects a flipper cabinet switch closure (during gameplay) it applies a 40msec pulse to the gate of the flipper drive transistor (STP22NE10L). If it continues to detect a flipper cabinet switch closure (the player holding the button in) it will continue to pulse the flipper drive transistor 1msec every 12msecs for the duration of the hold cycle.

COIN DOOR WIRING DIAGRAM

5.4 PRINTED CIRCUIT BOARDS

TROUGH UP-KICKER DUAL OPTO PCBS

THEORY OF OP. & SCHEMATIC

As light from the Transmitter LED1 falls on the Receiver LED1, it generates a Positive Bias Voltage (0.7v to 15.v) which is applied to the Gate (G) of Q1 (Fet 2N5460) turning Q1 off. When Q1 is held off, no current flows through Q2's (2N3906) Base (B). With no base current, Q2 is off and acts as an open switch, When the light is interrupted (blocked) R1 (Rec. Bd.) bleeds the gate voltage off of Q1 allowing it to conduct, switching Q2 on, which acts as a closed switch. The LED2 (Trans/Rec) Circuit operates identical as the LED1 Circuit.

TROUGH UP-KICKER DUAL OPTO PCBS

COMPONENT LAYOUT & PARTS

ITEM	QTY	PART NUMBER	REF-DESIGNATOR	DESCRIPTION
A+C & D	1	515-0173-00	Dual-OPTO Transmitter PCB Assembly (Item A PCB + Items C & D)	
A	1	520-5173-00	Dual-OPTO Transmitter PCB	(includes Items A-1 – A-3)
A-1	1	045-5111-02	CN1	2X, .156" Rt. Angle (26-60-5020) Conn.
A-2	2	165-5052-00	LED1, LED2	LED TLRH180P (Ultra Bright Red)
A-3	2	121-5067-00	R1, R2	180 Ω Resistor SMT, 1/8W (CRCW)
B+C & D	1	515-0174-00	Dual-OPTO Receiver PCB Assembly (Item B PCB + Items C & D)	
B	1	520-5174-00	Dual-OPTO Receiver PCB	(includes Items B-1 – B-7)
B-1	1	045-5111-03	CN1	3X, .156" Right Angle (26-60-5030) Conn.
B-2	2	165-5052-00	LED1, LED2	LED TLRH180P (Ultra Bright Red)
B-3	2	110-5006-00	Q1, Q3	2N5460, Transistor (P-FET SOT-23)
B-4	2	110-0086-00	Q2, Q4	2N3906, Transistor
B-5	2	121-5082-00	R1, R4	10M Ω Resistor SMT, 1/8W (CRCW)
B-6	2	121-5083-00	R2, R5	4.7K Ω Resistor SMT, 1/8W (CRCW)
B-7	2	121-5011-00	R3, R6	10K Ω Resistor SMT, 1/8W (CRCW)
C	3/per	530-5308-02		OPTO PCB Brass Tube Spacer
D	3/per	545-5518-00		OPTO PCB Rubber Grommet

Replacement Part:
LED TLRH180P
(T1-3/4 GaAlAs)
SPI Part N1:
165-5052-00

OPTO TROUBLESHOOTING

1. VOLT METER TEST (INDICATES NORMAL OPERATING CONDITION):

A. OPEN OPTO (Light Falling on LED) = SWITCH OPEN. Place meter leads across points A and B on the LED1 Circuit (Refer to Schematic Drawing on previous page, 520-5174-00 Receiver Side). It should read approximately 0.8 - 1.2v DC. The LED2 Circuit operates the same.

B. CLOSED OPTO (Light Blocked) = SWITCH CLOSED. Place meter leads across points A and B on the LED1 Circuit (Refer to Schematic Drawing on previous page, 520-5174-00 Receiver Side). It should read approximately 0.0 - 0.1v DC. The LED2 Circuit operates the same.

2. OSCILLOSCOPE TEST (INDICATES NORMAL OPERATING OCNDITION):

A. OPEN OPTO (Light Falling on LED) = SWITCH OPEN. Place Scope lead at Pin-1 of OPTO Rec. Board with Scope Grounded (see schematic). The Scope should display a steady +5v as shown in Fig. A, Wave Form Diagram.

B. CLOSED OPTO (Lighth Blocked) = SWITCH CLOSED. Place Scope lead at Pin-1 of OPTO Rec. Board with Scope Grounded (see schematic). The scope should display a Pulse Stream indicating Q2 has switched "On" as shown in Fig. B, Wave Form Diagram. This is your switch drive pulse.

3. BENCH TEST (SEE FIG. C):

Please Note: To perform this test you must use a spare 560 Ω Pull-Up Resistor, SPI No:121-5047-00

Disconnect the OPTO Transmitter/Receiver Board from the circuit. Connect one side of a 560 Ω Pull-Up Resistor to Pin-1 of the OPTO Receiver Bd. and the other side of the resistor to a 5v DC source. Connect Pin-2 to GND. Connect a +5v DC source to Pin-1 of the Transmitter & GND to Pin-2. Align with the Receiver OPTO approximately 3" distance. Using your Volt-Meter or an Oscilloscope, monitor Pin-1 while BLOCKING and UNBLOCKING the BEAM from the Trans. The output will be approximately +5v DC when the BEAM IS NOT BLOCKED and approximately 0v when the BEAM IS BLOCKED.

TROUGH DUAL OPTO BOARDS ALIGNMENT/TEST FOR LED1

When a working OPTO is installed and connected in a game, the transmitter should light (LED1 lower & LED2 upper) when the power is switched on. With the playfield in Service Position #1 (playfield lifted up in the half-way position resting on the prop rod or edge slide support brackets) and the game on, the LED lights should show up as BRIGHT RED RINGS through the back of the Receiver Board around the Receiver LED1 & LED2 (see Fig.1). Testing only LED1: With the game in Switch Test Mode, lifting the Trough Plunger with a fingertip should block the BEAM and cause the Switch Position to trigger (see Fig. 2). View Fig. 2a & 2b (on the next page) for a sectional view of the Light Path (note alignment) and what happens as a ball breaks the light beam.

SECTIONAL VIEW FROM RIGHT (FIG. 2A & 2B)

TROUGH DUAL OPTO BOARDS ALIGNMENT/TEST FOR LED2

When a working OPTO is installed and connected in a game, the transmitter should light (LED1 lower & LED2 upper) when the power is switched on. With the playfield in Service Position #1 (playfield lifted up and resting on the Playfield Support Slide Brackets) and the game on, the LED lights should show up as BRIGHT RED RINGS through the back of the Receiver Board around the Receivers LED1 & LED2 (see Fig. 1, previous page). Testing only LED2: TO PERFORM THIS TEST, A PINBALL MUST BE IN THE BALL TROUGH. With the game in Switch Test Mode, lifting the Trough Plunger with a finger tip should block the BEAM on LED2 and cause the Switch Position to trigger (see Fig. 3). View Fig. 3a & 3b for a sectional view of the Light Path (note alignment) and what happens as a “double stacked” ball scenario breaks the light beam.

IMPORTANT

If replacement of LED is required, insure that it is mounted correctly before and after soldering (See Fig. 4a/4b).

Playfield Terminal Strips

Explanation:

All Switches, Lamps & Coils require diodes. Coil diodes are located on the I/O Power Driver PCB (in Backbox). Some diodes from switches or lamps are moved onto Terminal Strips (*located under the playfield*). This is done where space constraints or excessive vibrations are present. The Switch & Lamp Matrix Grids also note which Switch or Lamp has a diode on a Terminal Strip, noted by **DOTS** (Diode On Terminal Strip).

Note: Some wires 'appear' to be doubled on the lugs. The switches and lamps are in a series, so you may see 1 or 2 wires depending where the switch or lamp is in the string.

Typical Switch Wiring & Schematic

... with Switch Diode on a Terminal Strip (DOTS)

Typical Lamp Wiring & Schematic

... with Lamp Diode on a Terminal Strip (DOTS)

Usually when a #555 Bulb is used as a Controlled Lamp for a Spot Light.

Typical Lamp Wiring & Schematic

... with Lamp Diode on a Terminal Strip (DOTS)

Usually when an LED Module is used as a Controlled Lamp for a Pop Bumper.

6. SPECIFICATIONS

500-55C7-01

SPECIFICATIONS, MECHANICAL, GAME SETUP

Specification	Imperial	Metric
Weight	210 lbs	96 kg
Max dimensions, leg levers extended (h, w, d)	78 x 27.75 x 57 in	198 x 70.5 x 145 cm
Minimum game dimensions (h, w, d)	76 x 27.75 x 57 in	193 x 70.5 x 145 cm
Minimum room dimensions per game (h, w, d)	80 x 36 x 84 in	203 x 91 cm x 214 cm

- (h, w, d) = height, width, depth.

SPECIFICATIONS, MECHANICAL, BOXED

Specification	Imperial	Metric
Weight, boxed (without pallet)	230 lbs	105 kg
Box dimensions (h, w, d)	56.5 x 31 x 31 in	144 x 79 x 79 cm
Minimum dimensions (h, w, d)	76 x 26 x 57 in	193 x 66 x 145 cm

- (h, w, d) = height, width, depth.

SPECIFICATIONS, ELECTRICAL

Specification	North America - 120VAC	International - 240VAC
Line Voltage, Nominal	120 VAC	240 VAC
Line Voltage Range	90 VAC - 250 VAC	90 VAC - 250 VAC
Line Frequency *	60 Hz	50 Hz, 60 Hz
Line Power, Current - attract mode	70 W, 0.6 A @ 120 VAC	70 W, 0.3 A @ 240 VAC
Line Power, Current - nominal	360 W, 3 A @ 120 VAC	360 W, 1.5 A @ 240 VAC
Line Power, Current - peak, <100 ms	540 W, 4.5 A @ 120 VAC	540 W, 2.25 A @ 240 VAC

* NOTE: Games designed for 60hz operation (e.g. North America games) will not function correctly on 50hz power and vice versa.

WARNING: Overloading electrical supply circuits is dangerous. Do not overload circuits. To calculate the maximum number of games for a circuit, check circuit amperage rating and divide by the game Nominal Line Power Current rating for your line voltage. For example, a 15A 120V household circuit, $15/3 \text{ A}$ (nominal current) = 5 games maximum.

SPECIFICATIONS, ENVIRONMENT

	Minimum	Maximum
Temperature, Operating	32 °F / 0 °C	104°F / 40 °C
Temperature, Storage	32 °F / 0 °C	104°F / 40 °C
Relative Humidity, Operating	5%	95% non-condensing
Relative Humidity, Storage	5%	95% non-condensing

- (a) "The appliance has to be placed in a horizontal position."
- (b) "This appliance is not to be cleaned by a Water Jet."
- (i) "Do not locate this appliance in an area where a Water Jet is used."
- (ii) "Do not clean this appliance with a Water Jet."
- (b) If the supply cord is damaged, it must be replaced in order to avoid a hazard.

6.1 GAME DIMENSIONS

6.2 WARRANTY

500-55C7-01

Stern Pinball machines are assembled in Elk Grove Village, Illinois, USA; each pinball machine has unique characteristics that make it a one-of-a-kind American-made product. Each machine will have variations in appearance resulting from differences in the machine's particular wood parts, individual silk screened art and mechanical assemblies. Stern Pinball has inspected each game element to insure it meets stringent quality and playability standards.

STERN PINBALL INC LIMITED WARRANTY

Stern Pinball Inc ("SELLER") warrants only to the initial purchaser of its products that the items listed below are free from defects in material and workmanship under normal use and service for the warranty period specified:

- Printed circuit boards (game logic): 2 months
- Dot Matrix Display boards: 9 months

No other parts of seller's product are warranted.

Warranty periods are effective from the initial date of shipment from seller to its authorized distributors.

Seller's sole liability shall be, at its option, to repair or replace products which are returned to seller during the warranty periods specified, provided:

1. Seller is notified promptly upon discovery by purchaser that stated products are defective.
2. Such products are properly packaged and then re-turned freight prepaid, to seller's plant.

This warranty does not apply to any parts damaged during shipment and/or due to improper handling, or due to improper installation or usage, or alteration. In no event shall the seller be liable for any anticipated profits, loss of profits, loss of use, accidental or consequential damages, or any other losses incurred by the customer in connection with the purchase of a Stern Pinball Inc Product.

WARRANTY DISCLAIMER

Except as specifically provided in a written contract between seller and purchaser, there are no other warranties, express or implied, including any implied warranties of merchantability or fitness for a particular purpose.

6.3 WARNINGS, COMPLIANCE, AND LEGAL NOTICES

500-55C7-01

PHOTOSENSITIVE SEIZURES HEALTH WARNING

A very small percentage of people may experience a seizure when exposed to certain visual images, including flashing lights or patterns. Even people with no history of seizures of epilepsy may have an undiagnosed condition that can cause "photosensitive epileptic seizures" due to certain visual images, flashing lights or patterns.

Symptoms can include light-headedness, altered vision, eye or face twitching, jerking or shaking of arms or legs, disorientation, confusion, momentary loss of awareness, and loss of consciousness or convulsions that can lead to injury from falling down or striking nearby objects.

IMMEDIATELY STOP PLAYING AND CONSULT A DOCTOR IF YOU EXPERIENCE ANY OF THESE SYMPTOMS.

PARTS SUBSTITUTIONS

For safety and reliability, substitute parts and equipment modifications are not recommended and may void any and all warranties. Use of Non-Stern Pinball Inc Parts or Modifications of game circuitry may adversely affect game play or game safety. Transport pinball machines with hinged backbox in the down position only!

Always take great care when servicing any game. Always ready the service manual before replacing or servicing components. Substitutions of parts or equipment modifications may void FCC type acceptance.

Always disconnect the line voltage before servicing. Some parts may remain energized when unplugged. Take great caution when serving any electrical components.

FCC CLASS A SUBPART J COMPLIANCE

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

RF INTERFERENCE NOTICE

The cable harness placements, ground strap routing, and other shielding have been designed to keep RF radiation and conduction within levels accepted by FCC rules. To maintain these levels, factory harness position, shielding, and ground straps must be installed in their factory locations should they become disconnected during maintenance.

COPYRIGHT AND INTELLECTUAL PROPERTY NOTICE

This document and the data disclosed herein or herewith is not to be reproduced (Except where noted), used, or otherwise disclosed in whole or in part to anyone without written consent of Stern Pinball Inc.

Products in this manual, the company name and devices and the design of the manual itself are protected by federal patents (and patents pending), design registrations, trademarks, and copyrights. Action will be taken in the event of infringement or imitation. The right is reserved to change specifications without prior notice.
